## BILL OF MATERIALS

OLIMEX ESP32-POE-ISO	QTY1, \$30
GENERIC SSD1306 128x64 DISPLAY	QTY1, \$10
GENERIC USB-C BREAKOUT PCB	QTY1, \$2
GENERIC BICOLOR LED	QTY1
GENERIC 500-ish RESISTOR	QTY1

## FLASH THE CODE

Project runs off esphome (esphome.io). Copy the code, and place it into a `xxx.yaml` file. Once you have the esphome CLI installed, you can navigate to the directory where you placed the yaml, and run the command `"esphome run xxx.yaml"`

The esp will be connected to your computer via the micro-usb during this process. Once a successful compile has completed, esphome will ask which port to flash to. Pick the corresponding port.

Once you install the config once, if you boot the device and connect it via eth to your lan, you will be able to flash a new config over the network instead of de-casing the esp32

Apologies for the ugly code

## CODE

## CASE

[li.wagoner.tech/esp32wwwcase](https://li.wagoner.tech/esp32wwwcase)  
Case is a remix of  
<https://www.thingiverse.com/thing:3857281> by user Zapdos  
and  
<https://www.printables.com/en/model/160473-terminal-for-ssd1306-13-oled-and-wemos-d1-mini-new> by user episco

## CASE CONSTRUCTION

Case put together with a lot of hot glue and some popsicle stick to serve as spacers and reinforcement
